## CSS min() All The Things

CSS, Tools, Techniques

written by **Victor Ayomipo**

Did you see [this post](#) that Chris Coyier published back in August? He experimented with CSS container query units, going all in and using them for every single numeric value in a demo he put together. And [the result](#) was... not too bad, actually.

See the Pen [Container Units for All Units \[forked\]](#) by [Chris Coyier](#).

What I found interesting about this is how it demonstrates the complexity of sizing things. We're constrained to absolute and relative units in CSS, so we're either stuck at a specific size (e.g., `px`) or computing the size based on sizing declared on another element (e.g., `%`, `em`, `rem`, `vw`, `vh`, and so on). Both come with
